

INSTALLING BALANCE SCREW INTO EASYVENT DOORS

- 1.) A #6 X 5/8" screw can be added to the bottom of the operating sash as shown below to keep the balance from being unseated.
- 2.) Make sure that the balance is seated properly. Then install the screw, from the outside of the door, into the operating sash heights on each side. A pilot hole may be drilled but is not necessary if a self drilling screw is used.
- 3.) This screw should NOT go through the balance itself but should instead be placed directly underneath the balance to keep it from moving up or down.

Picture taken from outside of door

- * This screw should be added to any store displays that are currently in the field.
- * This screw should also be added to any homeowner doors that a salesman is called out for.
